

Technical Bulletin # 27**June 02, 2004****Introduction of a new tinter TB 36**

Endura Manufacturing has researched and developed a new tinter to expand the EX-2C tinting line. The tinter is a finer aluminum flake than the other metallic tint bases: TB 37N and TB 38N. This new silver tinter will allow us more freedom to obtain an exact match and deliver a better end product. TB 36 is a finer metallic and therefore, the cost is greater. If customers wish to have a cooler rematched using TB 36 the cost of the color will increase.

Due to the fineness of TB 36, Endura recommends applying a coat of clear over colors that are high content TB 36 to attain a desired high gloss finish. Endura is very pleased with this addition and has started using the new tinter. We recommend you add this tinter to your tinting system for use in new colors.
