

Pearl Powder in Single Stage Color Matches

Color formulas with pearl powder and metallic combination could experience gloss dieback if not clear coated.

If an object is to be painted in a metallic single stage color it is best to match the color without pearl powder.

Do not combine pearl powders and metallic tint bases if the customer is not willing to clear coat.

All of these existing formulations with pearl powder and metallic tint bases need to be clear coated and cannot be used as single stage color.

Colors formulated with pearl powders should be clear coated to prevent gloss dieback as the pearl powder acts similarly to a gloss reducing pigment.
