

**Technical Bulletin #7****November 01, 2001****Clear coating**

In our effort to produce the highest quality product Endura Manufacturing Co. Ltd. only purchases the highest grade of pigments and resins available. This results in a product with excellent weathering characteristics. However it is the nature of all red, orange, yellow, and metallic pigments to degrade under UV light. In order to improve the weathering resistance of these pigments, we suggest that you clear coat any topcoat that is red, yellow, orange, or metallic with our Clear 100 or Clear 221. UV stabilizers are added to these clear coats during manufacturing to help extend the coating's lifespan and appearance.
